                                                                                                                           NOTE: This is a 'working draft' sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

NOIE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/dosgGenbank_draft_data.html).

NOIE: This is a 'working draft' sequence. It currently consists of 21 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FEATURES
Han, J., Montgomery, K.T., Grills, G., Lee, E., Long, J., Pomerantz, R., Ioshikhes, I.P., Shim, C., Decker, J., Thomas, E., Perera, A., Goltz, J.S. and Rucherlapati, R. Direct Submission
Submitted (11-AUG-2000) Department of Molecular Genetics, Albert Binstein College of Medicine Genome Center, 1300 Morris Park Ave., On Dec 28, 2000 this sequence version replaced gi:1199063).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    * NOTE: This is a 'working draft' sequence. It currently consists of 47 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N. but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              contig of 6470 bp in length contig of 9247 bp in length contig of 1299 bp in length contig of 10507 bp in length gap of unknown length contig of 2800 bp in length contig of 6514 bp in length gap of unknown length contig of 6514 bp in length gap of unknown length contig of 6514 bp in length gap of unknown length gap of unknown length contig of 5729 bp in length gap of unknown length gap of unknown length contig of 4876 bp in length gap of unknown length gap of unknown length contig of 4985 bp in length gap of unknown length gap of unknown length gap of unknown length contig of 5057 bp in length gap of unknown length gap of unknown length contig of 2603 bp in length gap of unknown length length length length length gap of unknown length length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequencing voctor: puc18; L08752

The present invention relates to a method for determining gene structure when the genomic sequence is unknown. The method involves sequencing the gene across soon intron boundaries using evenly spaced primers or tiled primers. The tiled primers comprises nucleic acids that hybridise to the known cDNA sequence of the gene at about 100-300 base determined and the gene comprises the template. Gene structure can be determined without the need to sequence the entire gene. The method provides information necessary to determine gene structure and phenotypic expression without the need to sequence entire chromosomal copy of the gene or fragment. The methods are useful in germline sequence variation analysis. The method is also useful for determining the boundaries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Determining structure of genes whose sequence is not known from cDNA, by sequencing the gene or gene across exon-intron boundaries using evenly spaced primers comprising nucleic acids that hybridize to the cDNA of gene

between regions of nucleic acids that were separated by intervening sequence, and also for determining boundaries present in genes containing stroup 1 type intruors such as Tetrahymena TRNA, where self-splicing occurs in the presence of guanosine cofactor. The present sequence is human cytochrome P450 (CYP450) 2C19 gene related to the invention.

biallelic markers. The sequences are related to various human genes including microsomal glutathione S-transferase II (MGSIII), malate decarboxylase enzyme (DMEI/MEI), cytochome P450, glutathione reductase/synthase (GSHR/GSHS), flavin-containing monooxygenases (FMO), gamma-glutamyltransferase 5 (GGTS), dipeptidase (DP), glucose 6-phosphate dehydrogenase (GFDM), phosphogluconate dehydrogenase (FCMI), and uridine diphosphate glucoronosyl transferases (UGTS). Each of these sequences contains a biallelic marker/polymorphism, which is represented in the sequence as a degenerate/undefined base. The genes to which the biallelic marker containing sequences are related are involved in drug metabolism. Sequences AMHS1594 - AAHS1599 represent the genomic sequence of the MGSIII gene products. PCR primers AAHS1599 and AAHS1500 are used in an example for the amplification of human genomic DNA fragments. The inext of a nucleotide at a DME- or MGSTII related biallelic marker in a biological sample. The method is used to determine the frequency in population of an allele of a DME- or MGSTII related biallelic marker and to select an individual for inclusion in a clinical trial of a drug treatment. The method is also used to detect association between allele
                                                           Human: biallelic marker; single nucleotide polymorphism: SNP; MGSIII: marcosomal glutarhione Stransferase II; malate decarboxylase enzyme: DMEI; WEI; cytochrome P450; glutarhione reductase; GSHR: GSHS; GGIS; flavin-containing monooxygenase; FMO; gamma-glutamyltransferase 5: flavin-ghpeptidase; DP; glucose 6-phosphate dehydrogenase; GSPDH: haplotype: phosphogluconate dehydrogenase; PGDH; drug metabolism: phenotype: uridine diphosphate glucoronosyl transferase; UGI2; asthma; hepatoxicity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and phenotype, and to detect association between haplotype and phenotype. The polynucleotides are used, in hybridization assays, sequencing assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequences AAH51110-AAH51593 represent human DNA fragments which contain
                   Human CYP2C8 related DNA containing a biallelic polymorphism SEQ ID 49
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           or allele specific amplification assays. The method can be used to determine whether an individual suffers or is at risk of developing asthma or is at risk of developing hepatoxicity on treatment with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polynucleotides comprising sequences from malate decarboxylase enzyme-related biallelic markers used for genotyping .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chumakov I, Cohen-Akenine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 13; Page 279; 673pp; English.

Sequences AAH51110-AAH51593 represent human DNA fragments which centain biallelic markers. The sequences are related to various human genes including microsomal glutathione S-transferase II (MGSIII), malate decarboxylase enzyme (DMEJ/MEI), cytochrome P450, glutathicne reductase/synthase (GSHR/GSHS), flavin-containing monooxygenases (FMO), gamma-glutamyltransferase 5 (GGTS), dipeptidase (DPH), quicose 5 phosphate contains a biallelic marker/DOlymorphism, which is represented in the contains a biallelic marker/DOlymorphism, which is represented in the sequence as a degenerate/undefined base. The genes to which the biallelic marker containing sequences are related are involved in drum metabolism. Sequence AAH51594 - AAH51599 represent the genomic sequence of the MGSIII gene and four alternative MGSIII conv. AAH51599 and AAH51500 are used in a nexample for the amplification of mann genomic DNA fragments. The invention includes a method of genotyphing comprising determining the identity of a nucleotide at a DME- or MGSTII related biallelic marker in population of an allele of a DME- or MGSTII related biallelic marker and to select an individual for inclusion in a clinical trial of a drug transment. The method is also used to determine the frequencing assays or allele specific amplification assays, sequencing assays or allele specific amplification assays, the method assays, sequencing assays or allele specific amplification assays. The method developing the allele specific and phanotype, and to detect association between haplotype and phenotype, and to detect association assays, sequencing assays or allele specific amplification assays. The method developing astays are the an individual suffers or is at risk of developing astaymance. The polynucleoptides are used, in hybridization assays, is at the developing astaymance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        3:

cc reductase/synthase (GSHR/GSHS), flavin-containing monooxyge:ases (FWO), gamma-glutamyltransferase 5 (GGT5), dipeptidase (DP), glucose 6-phosphate dehydrogenase (G6DBH), phosphaqluconate dehydrogenase (GBDH), and uridine cdiphosphate glucoronosyl transferases (UGT2). Each of these sequences contains a biallelic marker/polymorphism, which is represented in the sequences as a degenerate/undefined base. The genes to which the biallelic marker containing sequences are related are involved in drug metabolism. Sequences AAHSIS94 - AAHSIS98 represent the genomic sequence of the MGSTII gene and four alternative MGSTII cDNA sequences. AAHSIS906 are wisher on an example for the amplification of human genomic DNA fragments. The care wisher of a nucleotide at a DME- or MGSTII clated biallelic marker in a biological sample. The method is used to determine the frequency in population of an allele of a DME- or MGSTII related biallelic marker and constitution of an allele of a DME- or MGSTII related biallelic marker and constitution of an allele of a DME- or MGST-II related biallelic marker and constitution of an allele of a DME- or MGST-II related biallelic marker and constitution of an allele of a DME- or MGST-II related biallelic marker and constitution of an allele of a DME- or MGST-II related biallelic marker and constitution of an allele of a DME- or MGST-II related biallelic marker and constitution of an allele specific amplification assays. The method can be seed to a determine whether an individual suffers or is at risk of dereloping extermine as a stime or is at risk of developing hepatoxicity on treatment with zileuton

Human cytochrome P450 (CYP450) 2C19 gene PCR product #3.

m,

```
Structure when the genomic sequence is unknown. The method involves sequencing the gene across exon-intron boundaries using evenly spaced primers or tiled primers. The tiled primers comprises nucleic acids that hybridise to the known comprises the template. Gene structure can be intervals and the gene comprises the template. Gene structure can be repression without the need to sequence the entire gene. The method provides information necessary to determine gene. The method of sequence continuing the boundaries of analysis. The method is also useful in germline sequence variation sequence, and also for determining boundaries between regions of nucleic acids that were separated by intervening sequence, and also for determining boundaries present in genes containing group I type introns such as Tetrahymman rNAA, where self-splicing occurs in the presence of guanosine cofactor. The presence is a PCR product obtained from human cytochrome P450 (CYP450) 2C19 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                180

The present invention relates to a method for determining gene structure when the genomic sequence is unknown. The method involves sequencing the gene across exon-intron boundaries using everly spaced primers or tiled primers. The tiled primers comprises nucleic acids that hybridise to the known cDNA sequence of the gene at about 10-300 base intervals and the gene comprises the template. Gene structure can be determined without the need to sequence the entire gene. The method provides information necessary to determine gene structure and phenotypic expression without the need to sequence entire chromosomal copy of the gene or fragment. The method sare useful in germline sequence variation and ysis. The method is also useful for determining the boundaries

```

between regions of nucleic acids that were separated by intervening sequence, and also for determining boundaries present in genes containing group 1 type introns such as Tetrahymena rRNA, where self-spilcing occurs in the presence of guanosine cofactor. The present sequence is a PCR product obtained from human cytochrome P450 (CYP450) 2019 gene and 2350 primer related to the invention.

sequencing the genomic sequence is unknown. The method involves sequencing the gene across exon-intron boundaries using evenly spaced primers or tiled primers. The tiled primers comprises nucleic acids that hybridise to the known cDNA sequence of the gene at about 100-300 base intervals and the gene comprises the template. Gene structure can be a further the need to sequence the entire gene. The method by provides information necessary to determine gene structure and phenotypic expression without the need to sequence entire chromosomal copy of the gene or fragment. The methods are useful in germline sequence variation analysis. The methods are useful in germline sequence variation between regions of nucleic acids that were separated by intervening sequence, and also for determining boundaries present in genes containing in the presence of guanosine cofactor. The present sequence is a PCR product obtained from human cytochrome P450 (CYP450) 2019 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                        and 367U primer related to the invention.

```
This invention describes a recombinant cytochrome P450 protein which is purified from a host cell culture using a combination of detergents and enzyme inhibitors. The method comprises (a) fractionating the host cells to prepare their membranes, (b) adding a non-ionic detergent to the membranes in a concentration of 0.8% to 2% (w/v) in a detergent:protein ratio of between 4:1 to 10:1, (c) adding an ionic detergent:protein ratio of between 2:1 to 4:1 (d) centrifuging the membrane-detergent protein ratio of between 2:1 to 4:1 (d) centrifuging the membrane-detergent mixture to remove insoluble materials and (e) purifying the protein through a diethylaminocethyl-beaded column, then through a carboxymethyl-beaded column, and finally through a hydroxylapatite column. The method is used to purify cytochrome P450 proteins which are responsible for catalysing the oxidation of drugs, steroids, carcinogens and pesticides. The method simplifies the purification of P450 proteins, by the use of improved expression vectors
                                                                                                                                                                                                                                                                                                                                                                                    0

                                                                   The nucleotide sequence of the cDNA encoding the human cytochrome P450 vas amplified by PCR using the primers AA087735. The product was amplified by PCR using the primers AA087735. The product was closed into the yeast expression vectors pAAHSN or pAHRR to produce the vectors p2C9 for the expression of the cytochrome P450 alone or p2C9R for co-expression with the yeast NADPH*P450 reductase.

The vectors are used in a method for evaluating the safety of a chemical human cytochrome P450 molecular species 1A2 (AA087714), CC9, ZE1 (AA087716) or 3A4 (AA087717), or their auxillary species and variants or in cell extracts, and analysing the resulting metabolite to assess the safety of the chemical compound. The method is useful for determining vectors are the chemical compound. The method is useful for determining vectors are compounded or the method is useful for determining vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human cytochrome P450; amplified; PCR; polymerase chain reaction; primer;

This is the nucleotide sequence of the human cytochrome P450 molecular species 2C9 gene which encodes a protein of 490 amino acids. The gene was amplified from a human liver derived cDNA library as 2 fragments of 0.9 and 0.6 kb using primers AATS6925-8. The prod. was cloned into the cytochrome only or into the vector pARHS to generate the plasmid p2C9 for prodn. of the cytochrome only or into the vector pARHS to generate the plasmid p2C9 for prodn. of the cytochrome only or into the vector pARHS to generate the plasmid p2C9 for co-prodn. with the yeast NADPH-P450 reductase. The sequence is placed under control of the yeast NADPH-P450 reductase. The vectors are used in a method for evaluating the safety of a cpd. by reacting the test cpd. with recombinantly produced human cytochrome P450 mol. species 1A2 (AAT28380), 2C9, 2E1 (AAT28382), 3A4 (AAT28383) or their variants (AAT28380), 2C9, 2E1 (AAT28382), 3A4 (AAT28383) or eductase (either as a fused protein or as a cell extract) and analysing the resultant metabolite. The cpd. is considered "sife" if it is not detoxified or is metabolised to a carcinogenic cor "unsafe" if it is not detoxified or is metabolised to a carcinogenic cor "unsafe" if it is not detoxified or is sequence 1473 BP; 413 A: 345 C: 319 G: 396 T: 0 other;

is purified from a host cell culture using a combination of detergents and enzyme inhibitors. The method comprises (a) fractionating the host cells to prepare their membranes, (b) adding a non-ionic detergent to the membranes in a concentration of 0.8% to 2% (w/v) in a detergent: protein ratio of between 4:1 to 10:1, (c) adding an ionic detergent to the membranes in a concentration of 0.8% to 0.8% (w/v) in a detergent:protein ratio of between 7:1 to 4:1 (d) centrifying the membranes in through a diethylaminoethyl-beaded column, then through a carboxymethyl-beaded column, and finally through a protein through a diethylaminoethyl-beaded column, then through a carboxymethyl-beaded column, and finally through a hydroxylapatite column. The method is used to purify cytochrome P450 proteins which are responsible for catalysing the oxidation of drugs. Steroids, carcinogens and pesticides. The method simplifies the purification of P450 proteins, by the use of improved expression vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         126 cctagctctcaaaggtctatggccctgtgttcactctgtattttggcctgaaacccatag 185

                                                                                                                                                                            The present sequence encodes the human derived cytochrome (HDC) P45029, which was obtd. from a commercial cDNA library. Yeast were transfected with an expression vector contg. the HDC cDNA. cultured and then disrupted to give a microsomal fraction. The HDC was purified from the fraction, and used to immunise and sensitise a mammal. Blood was drawn from the mammal, and an anti-HDC antibody isolated. The antibody obtd. recognises HDC P4502C9, partic. at a serum dilution rate of 1:10000, and is substantially without cross reaction to other HDC P450 spp..

The present invention describes a fusion proteins comprising a portion of a bacterial cytochrome P450 protein and also a portion of a mammalian cytochrome P450 protein. The fusion protein can oxidise hydrocarbons or any compound having a carbon-hydrogen bond. The fusion protein can be used for hydroxylating a compound to be oxidised. It can also be used in the bioremediation of an environmental pollutant. Since the fusion protein is soluble, it can be subject to structural elucidation by X-ray crystallography for designing functional proteins. It can be readily expressed in soil bacteria to facilitate bioremediation. The present sequence encodes mammalian cytochrome P450 protein CYP2C9 from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytochrome P450 2C19; human; liver; PCR; primer; detection: CYP2C19; stereospecific S-mephenytoin 4'-hydroxylase activity; polymorphism; ss.

The sequences given in AATI1378-81 encode allelic variants of cytochrome 7450 209. The majority of clones isolated from liver S33 coded for 2C9. Of the 50 clones encoding 2C9, only two allelic variants were found. 39 cof the 2C9 clones were identical with clone 65, and 11 were identical with clone 25. Clones 25 and 65 are identical in the 5' and encoding regions but contained 2 single base changes at positions 3' roncoding regions but contained 2 single base changes at positions 3' roncoding regions but contained 2 single base changes at positions clones 29c and 6b differ by one nuclectide in the coding region. The clones 29c and 6b differ by one nuclectide in the coding region at position 385. Clone 29c has a very long, 198 bp, 5' roncoding region and a polyadenylation signal 21 bases from the poly-A tail. Clone 6b olyadenylation signal 21 bases from the poly-A tail. Clone 6b olyadenylation signals with no poly-A tail. The differences in the 3' con-coding regions could represent alternate splicing, allelic variants of 2018 because they differ by only one base in the coding region. They are most similar to 2C9 (82% amino acid homology).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           126 cctageteteaaagetetatggeeetgtgtteaetetgtattttggeetgaaacecatag 185

                                                                                                                                                         This sequence encodes a human cytochrome P450 2C9 polypeptide isolated from clone 65. This polypeptide is used in a method to screen for a drug that is metabolised by a cytochrome P450 having S-mephenytoin 4'-hydroxylase activity. The protein can also be used to identify a mutagenic, carcinogenic or cytotoxic compound. Cytochrome P450 are a large family of hemoprotein enzymes capable of metabolising xenobiotics such as drugs carcinogens and environmental pollutants as well as endoblotics such as steroids, fatty acids and prostaglandins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
